## PD Connect

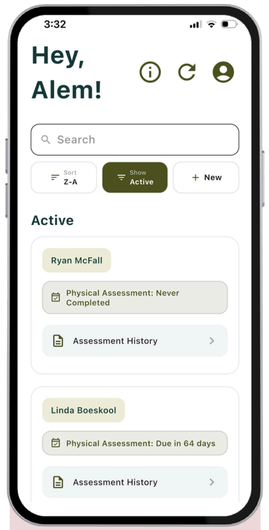

PD Connect is a secure, user-friendly application designed to help individuals living with Parkinson's Disease (PD) better understand, track, and share their health data over time.

## Purpose

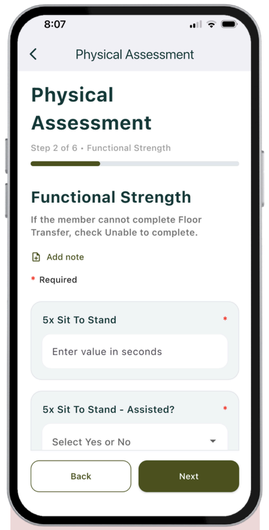

PD Connect centralizes resources for members of Evergreen Commons' (EGC) Parkinson's Disease program and staff members by streamlining member management, assessment tracking, symptom monitoring, and access to historical progression of data in one secure and organized platform. By organizing assessment and symptom data over time, the app also supports future data analysis that can help EGC evaluate the effectiveness of its PD program and make more informed decisions about member support.

The member interface was intentionally designed to support individuals living with PD. Since some users may experience motor, visual, or cognitive challenges, the app emphasizes readability, large touch targets, straightforward navigation, and a simple layout.

## Staff

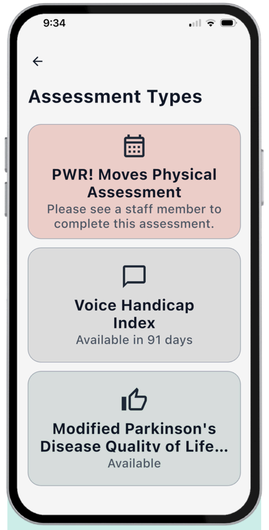

Staff can filter members by active status in Evergreen Commons and sort them alphabetically or soonest upcoming assessment

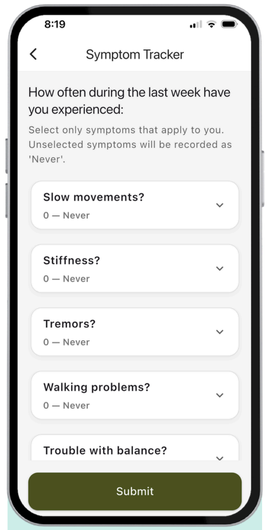

Staff administer quarterly physical assessments, while range checking helps catch unusual or incorrect values

## Member

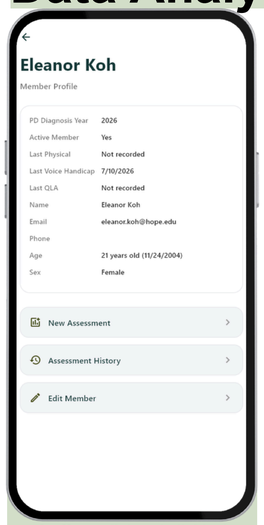

Members can complete independent quarterly assessments, and see EGC staff for physical assessments.

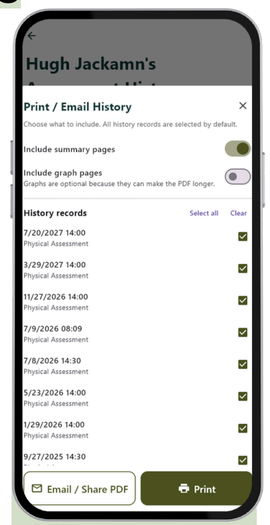

Members fill out a weekly questionnaire to track common symptoms of PD, as well as tracking custom symptoms

## Data Analysis

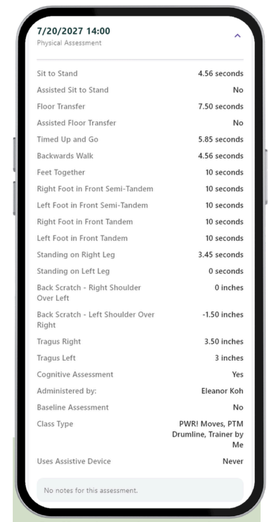

Staff can click on individual members to view their metadata, start a new assessment, see history, or edit member activity status

Staff and members can export their data as a PDF to send to their medical providers, or print out physical reports

Staff and members can view assessment history as graph-based summaries across all assessments of the same type

Staff and members can view assessment history as individual written summaries

## Features

- Complete standardized Parkinson's disease assessments within the app.
- Symptom tracking to record members' health changes over time and any symptoms they are experiencing
- View previous assessment results through summaries and graphs, including the ability to print, email or export reports
- Access to assessments and health information from a centralized interface

## Future Work

- Expanding from a mobile app to a web app
- Visualize data access across all members
- Ability to export CSV of selected users for data analysis
